

Xilinx Test Programs

Tom Kelliher, CS 240

Apr. 4, 2008

This document will describe how to:

1. Run the test programs.
2. Assign pin constraints for problem 5-18.
3. Assign pin constraints for the second part of problem 5-24.

1 Running the Test Programs

1. Download the two test driver programs from the class Web site. They are named `comp2.exe` and `handshake.exe`. Source code is available for your inspection.
2. Configure the FPGA with a bitstream. Then, open a command line window. Usually, you do this by selecting MSDOS prompt from the Programs menu. In the X Lab, from the Start menu open the Run box, type `command`, and press Enter.
3. Using `cd` in the command line window, navigate to the folder containing the executable test program. Type its name and press Enter. It will begin to run.

2 Pin Constraints for Problem 5-18

Signal	Location
clk_ext	P50
X	P42
Y	P47
Z	P40

3 Pin Constraints for Problem 5-24

Remember that `reset` is active low.

Signal	Location
clk_ext	P50
reset	P48
R	P42
A	P47
E	P40
